### Segmented Worms Worksheets - Learny Kids

Earthworms are segmented worms. Segmented worms are in the phylum Annelida, which has over 22,000 known species. These worms are known as the segmented worms because their bodies are segmented, or separated into repeating units. Besides the earthworm, the segmented worms also include leeches and some marine worms. Most segmented worms like the earthworm, feed on dead organic matter.

### **Earthworm Questions Answer Key**

Annelids include earthworms, marine worms, such as the ones shown in Figure 25.22, and parasitic leeches. All of these worms are different from flatworms and roundworms because they are segmented and have a coelom. Most annelids also have a larval stage that is similar to that of certain mollusks, suggesting a common ancestor.

### **Segmented Worms - BIOLOGY 11**

Segmented worms use their setae to hold on to the soil and to move. Describe how an earthworm takes in and digests its food. When the earthworm takes in soil through its mouth it moves to the crop, which is a sac used for storage.

oligochaeta. the class of the earthworm (means "few bristles") annelida. the phylum of the segmented worms. leech. an external parasite that sucks the blood and body fluids of their host. polychaete. marine annelids that have paired, paddlelike appendages tipped with setae. aortic arches.

### **Segmented worms Questions and Study Guide | Quizlet ...**

Annelids are worms with cylindrical bodies segmented both internally and externally, which includes earthworms. What helps an earthworm dig through the soil and where is it located? The earthworm digs the soil as it grips the dirt with tiny stiff bristles on the tail end of its body. Then it stretches its body forward.

### **Segmented Words- The Earthworm Flashcards | Quizlet**

Great Lakes Worm Watch :: Worm Identification Earthworms are animals in the phylum Annelida, class Clitellata and subclass Oligochaeta. Class Clitellata consists of the two subclasses Hirudinea (leeches) and Oligochaeta. Both are segmented worms which possess a clitellum, or saddle. So leeches are the closest living relatives to earthworms.

### **Earthworm Identification Guide**

An earthworm is a segmented worm; a terrestrial invertebrate belonging to the phylum Annelida. They are the common inhabitants of moist soil and feed on organic matter. Earthworms are commonly called as farmer's friend. This is because the worm casting (faecal deposit) increases the fertility and burrowing helps in proper aeration of the soil.
